

User Story 1 - Creating a kDAO

As Alice, I want to use Kairos to create a kDAO so that I can organise my local art community.

Acceptance Criteria

- A user needs to be able to initiate the creation of the kDAO from the homepage by clicking the create kDAO button.
- A user must be able to write the type of kDAO they want to create to be provided a suggested template
- A user must be given a suggested template by Kairos.
- The suggested Template must be configurable with different modules (TBD)
- A user must be able to create the kDAO without having to link a wallet.
- A user must be able to create the kDAO without having to create a legal entity.

Description

Alice wants to create a kDAO so she can organise her Art community. Alice is still learning about DAOs so she wants to be able to create a kDAO immediately and use Kairos composability and modularity to customize the kDAO's characteristics after she gets accustomed to the different options in the sandbox version of Kairos (i.e. before connecting wallet and deploying the kDAO on the Terra blockchain).

She enters Kairos homepage, locates and selects the create kDAO icon. From here she is taken to page where she is prompted to connect her wallet but is given the choice to postpone it which will take her to a "sandbox" version of Kairos. She then needs to write the type of activity or reason for the creation of the kDAO. Kairos returns a template with specific modules relevant to her use case. Alice is free to change the suggested modules and confirms when ready, taking her to her kDAO dashboard.
